

Let's calculate smth with a given function: $f(\text{ded}, y) = \text{ded} \cdot y^{2.000}$

Firstly, let's insert all constants and simplify this expression: $f(\text{ded}, y) = \text{ded} \cdot y^{2.000}$

BRITISH SCIENTISTS WERE SHOCKED, WHEN THEY COUNT IT!!!

In the point ($\text{ded} = 3.000$, $y = 2.000$) it's value = 12.000

Personally, I've always thought about first derivation of something like that function... Haven't you?

But now, by using informatics and math skills I feel that I'm prepared enough to calculate it!

1 step. finding a derivation of:

$$y$$

While preparing for exams, I learned a lot of new things, for example: $(y)' = 1.000$

2 step. finding a derivation of:

$$y^{2.000}$$

It's really easy to find: $(y^{2.000})' = 2.000 \cdot y$

3 step. finding a derivation of:

$$\text{ded}$$

My roommate mumbled it in his sleep all night: $(\text{ded})' = 1.000$

4 step. finding a derivation of:

$$\text{ded} \cdot y^{2.000}$$

Sounds logical that it is the same as: $(\text{ded} \cdot y^{2.000})' = y^{2.000} + 2.000 \cdot y \cdot \text{ded}$

Congratulations! The first derivation of the expression is:

$$y^{2.000} + 2.000 \cdot y \cdot \text{ded}$$

In the point ($\text{ded} = 3.000$, $y = 2.000$) it's value = 16.000

Let's calculate the 3 derivation of the expression:

Calculating the 1 derivation of the expression:

1 step. finding a derivation of:

$$y$$

For centuries, people have hunted for the secret knowledge that: $(y)' = 1.000$

2 step. finding a derivation of:

$$y^{2.000}$$

Sounds logical that it is the same as: $(y^{2.000})' = 2.000 \cdot y$

3 step. finding a derivation of:

$$\text{ded}$$

It's really easy to find: $(\text{ded})' = 1.000$

4 step. finding a derivation of:

$$\text{ded} \cdot y^{2.000}$$

My roommate mumbled it in his sleep all night: $(\text{ded} \cdot y^{2.000})' = y^{2.000} + 2.000 \cdot y \cdot \text{ded}$

Calculating the 2 derivation of the expression:

1 step. finding a derivation of:

$$\text{ded}$$

What if it equals: $(\text{ded})' = 1.000$

2 step. finding a derivation of:

$$y$$

It's really easy to find: $(y)' = 1.000$

3 step. finding a derivation of:

$$2.000$$

Even my two-aged sister knows that it equals: $(2.000)' = 0.000$

4 step. finding a derivation of:

$$2.000 \cdot y$$

When I was child, my father always told me: "Remember, son: $(2.000 \cdot y)' = 2.000$

5 step. finding a derivation of:

$$2.000 \cdot y \cdot \text{ded}$$

I spend the hole of my life to find the answer and finally it's: $(2.000 \cdot y \cdot \text{ded})' = 2.000 \cdot \text{ded} + 2.000 \cdot y$

6 step. finding a derivation of:

$$y$$

Man... Just look: $(y)' = 1.000$

7 step. finding a derivation of:

$$y^{2.000}$$

For centuries, people have hunted for the secret knowledge that: $(y^{2.000})' = 2.000 \cdot y$

8 step. finding a derivation of:

$$y^{2.000} + 2.000 \cdot y \cdot \text{ded}$$

It's really easy to find: $(y^{2.000} + 2.000 \cdot y \cdot \text{ded})' = 2.000 \cdot y + 2.000 \cdot \text{ded} + 2.000 \cdot y$

Calculating the 3 derivation of the expression:

1 step. finding a derivation of:

$$y$$

It's simple as fuck: $(y)' = 1.000$

2 step. finding a derivation of:

$$2.000$$

thanks to the results of my colleagues' scientific work, I know that it equals: $(2.000)' = 0.000$

3 step. finding a derivation of:

$$2.000 \cdot y$$

When I was child, my father always told me: "Remember, son: $(2.000 \cdot y)' = 2.000$

4 step. finding a derivation of:

$$\text{ded}$$

It’s really easy to find: $(ded)' = 1.000$
5 step. finding a derivation of:

$$2.000$$

I was asked not to tell anyone that: $(2.000)' = 0.000$
6 step. finding a derivation of:

$$2.000 \cdot ded$$

For centuries, people have hunted for the secret knowledge that: $(2.000 \cdot ded)' = 2.000$
7 step. finding a derivation of:

$$2.000 \cdot ded + 2.000 \cdot y$$

My roommate mumbled it in his sleep all night: $(2.000 \cdot ded + 2.000 \cdot y)' = 4.000$
8 step. finding a derivation of:

$$y$$

What if it equals: $(y)' = 1.000$
9 step. finding a derivation of:

$$2.000$$

Even my two-aged sister knows that it equals: $(2.000)' = 0.000$
10 step. finding a derivation of:

$$2.000 \cdot y$$

I spend the hole of my life to find the answer and finally it’s: $(2.000 \cdot y)' = 2.000$
11 step. finding a derivation of:

$$2.000 \cdot y + 2.000 \cdot ded + 2.000 \cdot y$$

Even my two-aged sister knows that it equals: $(2.000 \cdot y + 2.000 \cdot ded + 2.000 \cdot y)' = 6.000$
Finally... The 3 derivation of the expression:

$$6.000$$

BRITISH SCIENTISTS WERE SHOCKED AGAIN, WHEN THEY COUNT THE 3 DERIVATION OF THIS EXPRESSION!!!

In the point (ded = 3.000, y = 2.000) it’s value = 6.000
Partial derivation of the expression on the variable ded:

$$\frac{\partial f}{\partial ded} = 4.000$$

In the point (ded = 3.000, y = 2.000) it’s value = 4.000000 !!!

Partial derivation of the expression on the variable y:

$$\frac{\partial f}{\partial y} = 3.000 \cdot 2.000 \cdot y$$

In the point (ded = 3.000, y = 2.000) it’s value = 12.000000 !!!

Full derivation:

$$\sqrt{16.000 + (3.000 \cdot 2.000 \cdot y)^{2.000}}$$

In the point (ded = 3.000, y = 2.000) it’s value = 12.649 !!!

Let’s consider the expression as a function of ded variable: $f(ded) = 4.000 \cdot ded$

Maklorens formula for $ded \rightarrow 3.000$: $f(ded) = 12.000 + 4.000 \cdot (ded - 3.000) + o((ded - 3.000)^{4.000})$

Graph f(ded):

Tangent equation in the point ded = -2.000: $f(ded) = 4.000 \cdot (ded - (-2.000)) + (-8.000)$
Normal equation in the point ded = -2.000: $f(ded) = (-0.250) \cdot (ded - (-2.000)) + (-8.000)$
