Firstly, let's insert all constants and simplify this expression: f(x, y) = \sin x \cdot y^{2.000}
   BRITISH SCIENTISTS WERE SHOCKED, WHEN THEY COUNT IT!!!
   In the point (x = 3.000, y = 2.000) it's value = 0.564
   Personally, I've always thought about first derivation of something like that function... Haven't you?
   But now, by using informatics and math skills I feel that I'm prepared enough to calculate it!
   1 step. finding a derivation of:
   While preparing for exams, I learned a lot of new things, for example: (y)' =
=1.000
   2 step. finding a derivation of:
   It's really easy to find: (y^{2.000})' =
=2.000 \cdot y
   3 step. finding a derivation of:
   My roommate mumbled it in his sleep all night: (x)' =
=1.000
   4 step. finding a derivation of:
   \sin x
   Sounds logical that it is the same as: (\sin x)' =
   5 step. finding a derivation of:
   \sin x \cdot y^{2.000}
   For centuries, people have hunted for the secret knowledge that: (\sin x \cdot y^{2.000})' =
=\cos x \cdot y^{2.000} + 2.000 \cdot y \cdot \sin x
   Congratulations! The first derivation of the expression is:
   \cos x \cdot y^{2.000} + 2.000 \cdot y \cdot \sin x In the point (x = 3.000, y = 2.000) it's value = -3.395
   Let's calculate the 4 derivation of the expression:
